 Cytology

## CLINICAL INFORMATION:

**SOURCE:**  
 Mass on the caudoventral abdomen over the left and right mammary gland area. Three slides

## DESCRIPTION/MICROSCOPIC FINDINGS/COMMENTS:

**DESCRIPTION:**  
 The slides are extremely cellular containing large numbers of slightly degenerate neutrophils with increased numbers of macrophages. Some of the macrophages are activated and vacuolated and contain erythrocytes. There are scattered small lymphocytes, plasma cells and eosinophils. Bacterial and fungal agents are not identified and neoplastic cells are not observed.

## MICROSCOPIC FINDINGS: MIXED CELL INFLAMMATION.

**COMMENT:**  
 Differentials for this lesion should include a puncture wound, foreign body as well as an insect/spider bite. An infectious etiology cannot be completely ruled out. Mammary tissue is not observed on the smears. Bacterial culture with antibiotics sensitivity may be informative. If this lesion does not resolve with medical intervention, surgical removal with histopathology would be warranted.
